

Question No.		Solution												
1	(a)	Population: All the animal bites in Kentucky. Sample: 280 animal bites in Kentucky recorded in the dataset.												
	(b)	SpeciesIDDesc	Qualitative	Nominal										
		GenderIdDesc	Qualitative	Nominal										
		Color	Qualitative	Nominal										
		WhereBittenDesc	Qualitative	Nominal										
	(c)	Mean = \$2,748 Median = \$2,672												
	(d)	Non-normal There are several bins that are of the similar height. OR The histogram is not bell-shaped. OR The histogram is not symmetrical about the mean.												
	(e)	CAT, DOG & RACCOON 15.7%, 77.9% & 6.4% respectively.												
	(f)	BODY & HEAD 80.7% and 19.3% respectively.												
(g)	“The middle 50% of the fines imposed on racoon owners are between \$ <u>1,513</u> and \$4,153.” IQR is <u>\$2,641</u> . “ The middle 50% of fines imposed on dog owners are between \$1,649 and <u>\$3,943</u> .” IQR is <u>\$2,294</u> . “The middle 50% of fines imposed on cat owners are between \$1,377 and <u>\$3664</u> .” IQR is \$2,287.													
(h)	<table><tr><th>Variable</th><th>Total Count</th><th>Mean</th><th>Minimum</th><th>Maximum</th></tr><tr><td>Fine (USD)for dog bites</td><td>218</td><td>2759.0</td><td>519.0</td><td>4995.0</td></tr></table>				Variable	Total Count	Mean	Minimum	Maximum	Fine (USD)for dog bites	218	2759.0	519.0	4995.0
Variable	Total Count	Mean	Minimum	Maximum										
Fine (USD)for dog bites	218	2759.0	519.0	4995.0										
(i)	The most common animal bites are from the dogs with the highest proportion of 77.9%.  They could look at imposing a higher minimum fine to ensure that dog owners keep a close watch on their pets.													

Question No.	Solution															
2	(a)	Let $\mu$ be <u>mean winnings claim amount</u> . $H_0: \mu = \$2,000$ (or $\mu \geq \$2,000$ ) $H_1: \mu < \$2,000$														
	(b)	Sample size, $n = 304$  Sample mean, $\bar{x} = \$1941.94$  Sample SD, $s = \$440.17$ <div><p>Statistics</p><table><tr><th>Variable</th><th>N</th><th>Mean</th><th>StDev</th></tr><tr><td>Winnings Claim</td><td>304</td><td>1941.94</td><td>440.17</td></tr></table></div>	Variable	N	Mean	StDev	Winnings Claim	304	1941.94	440.17						
Variable	N	Mean	StDev													
Winnings Claim	304	1941.94	440.17													
	(c)	P-Value = 0.011 (1-sample t) <div><p>Test</p><p>Null hypothesis <math>H_0: \mu = 2000</math> Alternative hypothesis <math>H_1: \mu &lt; 2000</math></p><table><tr><th>T-Value</th><th>P-Value</th></tr><tr><td>-2.30</td><td>0.011</td></tr></table></div> <p>95% confidence (Upper) bound for <math>\mu</math> is : <math>\mu &lt; 1983.59</math></p> <div><p>Descriptive Statistics</p><table><tr><th>N</th><th>Mean</th><th>StDev</th><th>SE Mean</th><th>95% Upper Bound for <math>\mu</math></th></tr><tr><td>304</td><td>1941.9</td><td>440.2</td><td>25.2</td><td>1983.59</td></tr></table><p><math>\mu</math>: population mean of Winnings Claim (\$)</p></div>	T-Value	P-Value	-2.30	0.011	N	Mean	StDev	SE Mean	95% Upper Bound for $\mu$	304	1941.9	440.2	25.2	1983.59
T-Value	P-Value															
-2.30	0.011															
N	Mean	StDev	SE Mean	95% Upper Bound for $\mu$												
304	1941.9	440.2	25.2	1983.59												
	(d)	P-Value = 0.011 < 5%  Furthermore, the 95% confidence bound does not include hypothesized mean of \$2,000.														

Question No.		Solution																				
		<p>Hence, reject <math>H_0</math></p> <p>There is evidence to believe that the average winnings claim is lesser than \$2,000</p>																				
	(e)	<p>If the conclusion in (d) is “Reject <math>H_0</math>” (which is the correct answer): Since we rejected <math>H_0</math>, the conclusion in (d) will not change because if we use a 90% confidence interval/bound, the confidence bound will decrease (or the critical region will increase) to make the analysis to favour <math>H_1</math> even more.</p> <div><p><b>Descriptive Statistics</b></p><table><tr><th></th><th>N</th><th>Mean</th><th>StDev</th><th>SE Mean</th><th>90% Upper Bound for <math>\mu</math></th></tr><tr><td></td><td>304</td><td>1941.94</td><td>440.17</td><td>25.25</td><td>1974.36</td></tr></table><p><math>\mu</math>: population mean of Winnings Claim</p></div>		N	Mean	StDev	SE Mean	90% Upper Bound for $\mu$		304	1941.94	440.17	25.25	1974.36								
	N	Mean	StDev	SE Mean	90% Upper Bound for $\mu$																	
	304	1941.94	440.17	25.25	1974.36																	
3	(a)	<p>Scenario 1:</p> <table><tr><th>Condition</th><th>Fulfilled?</th></tr><tr><td>There is a repeated fixed number of trials or observations, <math>n</math>.</td><td><u>Y</u> / N</td></tr><tr><td>All these trials are independent.</td><td>Y / <u>N</u></td></tr><tr><td>Each trial should end in one of two outcomes: success or failure.</td><td><u>Y</u> / N</td></tr><tr><td>The probability of success, <math>p</math>, must be the same for all trials.</td><td>Y / <u>N</u></td></tr></table> <p>Scenario 2:</p> <table><tr><th>Condition</th><th>Fulfilled?</th></tr><tr><td>There is a repeated fixed number of trials or observations, <math>n</math>.</td><td><u>Y</u> / N</td></tr><tr><td>All these trials are independent.</td><td><u>Y</u> / N</td></tr><tr><td>Each trial should end in one of two outcomes: success or failure.</td><td><u>Y</u> / N</td></tr><tr><td>The probability of success, <math>p</math>, must be the same for all trials.</td><td><u>Y</u> / N</td></tr></table>	Condition	Fulfilled?	There is a repeated fixed number of trials or observations, $n$ .	<u>Y</u> / N	All these trials are independent.	Y / <u>N</u>	Each trial should end in one of two outcomes: success or failure.	<u>Y</u> / N	The probability of success, $p$ , must be the same for all trials.	Y / <u>N</u>	Condition	Fulfilled?	There is a repeated fixed number of trials or observations, $n$ .	<u>Y</u> / N	All these trials are independent.	<u>Y</u> / N	Each trial should end in one of two outcomes: success or failure.	<u>Y</u> / N	The probability of success, $p$ , must be the same for all trials.	<u>Y</u> / N
Condition	Fulfilled?																					
There is a repeated fixed number of trials or observations, $n$ .	<u>Y</u> / N																					
All these trials are independent.	Y / <u>N</u>																					
Each trial should end in one of two outcomes: success or failure.	<u>Y</u> / N																					
The probability of success, $p$ , must be the same for all trials.	Y / <u>N</u>																					
Condition	Fulfilled?																					
There is a repeated fixed number of trials or observations, $n$ .	<u>Y</u> / N																					
All these trials are independent.	<u>Y</u> / N																					
Each trial should end in one of two outcomes: success or failure.	<u>Y</u> / N																					
The probability of success, $p$ , must be the same for all trials.	<u>Y</u> / N																					
	(b)(i)	<p>Let <math>X</math> = number of buses that breakdown in a day.</p> <p><math>X \sim B(n = 20, p = 0.03)</math></p>																				

Question No.		Solution
	(b)(ii)	Mean = $m = np = 20 \times 0.03 = 0.6$
	(b)(iii)	$P(X = 1)$ $= 0.336$
	(b)(iv)	$P(X \leq 1)$ $= P(X = 0) + P(X = 1)$ $= 0.544 + 0.336$ $= 0.88$
	(b)(v)	$P(X \geq 2) = 1 - P(X \leq 1) = 0.12$ Alternative $P(X \geq 2) = P(X=2) + P(X=3) = 0.12$ . The probabilities for the remaining X values is 0.
	(b)(vi)	Since $P(X \geq 2) = 0.12$ . It is not rare to have 2 breakdowns of more per day. So LOCO should hire a full time staff.  Since $P(X \geq 2) = 0.12$ is small, LOCO should outsource.  Since mean of 0.6, the expected breakdown is 0.6 per day. $0.6 < 2$ . So LOCO should outsource.
	(c)(i)	$Y \sim N(11, 4)$
	(c)(ii)	$P(Y < 10)$ $= 0.3085 = 0.309$ (to 3 d.p)
	(c)(iii)	$P(10 < Y < 12)$ $= 0.3829$ $= 0.383$ (to 3 d.p)
4	(a)(i)	$\bar{T} \sim N\left(30, \frac{64}{n}\right)$  Assumptions: The distribution for journey time per delivery is normally distributed.
	(a)(ii)	$P(\text{total journey time} > 600)$ $= P(n\bar{T} > 600)$ $= P(\bar{T} > 600/16)$  $= P(\bar{T} > 37.5)$ $= 0.0000884$
	(a)(iii)	$P(\text{total journey time} > 600)$ $= P(n\bar{T} > 600)$

Question No.	Solution
	$=P(\bar{T} > 600/17)$ $=P(\bar{T} > 35.294)$ $= 0.00406$ <p>Yes, since the probability is close to 0 (&lt;5%), it is a rare event.</p>
(a)(iv)	<p>Maximum delivery is 16 since the probability of the truck driver exceeding the 10 hours driving limit when n is 17 is 0.00406 which is more than 1 in 1000 (or 0.001) whereas when n is 16, the probability is 0.0000884 which is less than 1 in 1000 (or 0.001).</p>
(b)(i)	<p>Since <math>n = 50 (&gt;30)</math>, <math>\bar{M}</math> is approximately normally distributed by <u>Central Limit Theorem</u>.</p> $\bar{M} \sim N(65, \frac{100}{50} = 2)$
(b)(ii)	<p>Using Minitab,  <math>P(\bar{M} &gt; 64)</math>  <math>= 0.7603</math></p>
(b)(iii)	<p>If the scripts were from <i>City XYZ</i>, we have <math>\bar{M} \sim N(65, 2)</math>  <math>P(\bar{M} &gt; 68.5) = 0.006657</math></p>
(b)(iv)	<p>Likelihood that we have a sample with mean of 68.5 or more if it is from <i>City XYZ</i> is <math>0.0068 \ll 0.05</math>, which is <u>rare</u>.</p> <p>Hence we have evidence to conclude that the scripts are <u>not from City XYZ</u>.</p>
